In this post, we are going to show how cantilever retaining walls can be analysed and designed on Staad Pro software, and also compare the answer obtained with classical solutions. We should know that retaining walls must satisfy geotechnical, equilibrium, structural, upheaval, seismic considerations, etc.

Analysis and Design of Cantilever Retaining Walls on Staad Pro

Although STAAD.Pro does not have a specific design for retaining walls but based on the moments calculated from the FE Analysis, it can calculate reinforcement requirement as per various concrete design codes like the ACI 318, IS 456, CAN/CSA A23.3 etc.

Surcharge pressure at the back of the retaining wall = $0.333 \times 10 = 3.33 \text{ kN/m}^2$. Earth pressure on the base (heel) = $(7\text{m} \times 19 \text{ kN/m}^3) = 133 \text{ kN/m}^2$ Surcharge pressure on the base (heel) = 10 kN/m^2 Watch the video for analysis of counterfort retaining walls on Staad Pro below:

Staad Pro Retaining Wall Analysis The retaining wall is subjected to a 3m thick earthfill, and a variable surcharge pressure of 10 kPa. Given that the retained earth has an angle of internal friction of 30°, we can obtain the Rankine active earth pressure as follows; $k_a = (1 - \sin 30) / (1 + \sin 30) = 0.333$.

DESIGN AND ANALYSIS OF RETAINING WALLS 8.1 INTRODUCTION Retaining walls are structures used to provide stability for earth or other materials at their natural slopes. In general, they are used to hold back or support soil banks and water or to maintain difference in the elevation of the ground surface on each of wall sides. Also, retaining
